

INTRODUCING

CORTEXKEY

The first accessible **Brain-Computer Interface** that
authenticates you based on **how you THINK**.

DYNAMIC NEURAL AUTHENTICATION

WHY CURRENT SECURITY FAILS

STATIC BIOMETRICS = PERMANENT RISK

Fingerprints and faces are immutable. Once spoofed or lifted from a glass, your credential is compromised **forever**.

PASSWORDS ARE THE WEAKEST LINK

Text credentials are reusable, guessable, and highly vulnerable to social engineering. 81% of breaches are due to weak passwords.

NO "LIVENESS" PROOF

Standard systems struggle to distinguish between a living user and a 3D mask, deepfake, or "dead finger" attack.

SYSTEM
VULNERABLE

DYNAMIC NEURAL AUTHENTICATION

CortexKey replaces static credentials with a live, physiological signal. Instead of typing, you **THINK**.

THINK

User performs a specific mental task (e.g., "Hyper-focus" or "Motor Imagery").

CAPTURE

Sensors capture unique EEG patterns from the frontal cortex.

PROCESS

ESP32 processes signal & extracts "Neural Signature".

UNLOCK

Device authenticates instantly.
Hands-free & Secure.

WHY CORTEX KEY?

UN-HACKABLE LAYER

Serves as the ultimate **Second Factor (2FA)** for high-stakes environments like defense, banking, and secure remote exams.

REVOCABLE BIOMETRICS

Unlike a fingerprint, if your "neural key" is compromised, you can simply **train a new thought pattern**. You can change your mind; you can't change your finger.

IMPOSSIBLE TO STEAL

Brainwaves are internal and invisible. They cannot be photographed, lifted from a glass, or spoken aloud. The system **requires you to be alive** to work.
